

The background image shows a food processing facility with various machines. A prominent vertical stainless steel tube with a blue motor at the top is on the left. In the foreground, there are flexible hoses connected to a machine with a perforated metal surface. The entire image has a blue color overlay.

AUTOMATED & SUSTAINABLE WASTE HANDLING FOR FOOD PACKAGING

 **LUNDBERG**^{TECH}
Our waste handling keeps production going

CONVERTING WASTE TO CREATE VALUE

For 40+ years we've been keeping our customers' production going by capturing, cutting, conveying, collecting, and compacting waste in a clean sustainable process.

By improving safety, increasing efficiency, and reducing CO₂ emissions we add value to your triple bottom line of people, profits and planet.

Turn today's challenges into tomorrow's advantage

Cost reductions, harder access to qualified employees and high labour costs have made automation essential to growth. Add demands for reductions in CO₂ emissions, stricter environmental legislation and ESG sustainability reporting, and tomorrow's challenges can seem complex.

A waste handling solution that can help towards addressing some of these challenges can give you a competitive advantage.

One solution – multiple paybacks

Solve many challenges with one single solution: A waste handling system that improves productivity, reduces downtime, while cutting waste handling costs and CO₂ emissions with compact, easy to transport, second-life usage material.

Our scalable modular automated waste handling system offers world leading durability and reliability, and our solutions do more than keep your production going - they prepare you for a competitive, sustainable future.

Sustainability and recycling

In addition to cutting material at the packaging machine for potential second-life usage, the reduction in volume of the compacted waste requires less transport, lowering the company's CO₂ burden.

With shredder solutions we also reduce the size of empty packages from the production area for collection. Sheets or bags of plastic or paper from packaging and unpacking processes can also be removed using WasteFlex technology.

A safer work environment

Preventing injury at work is an important part of today's business requirements.

Less heavy lifting is required to move waste material from the packaging line to shipping for disposal. Additionally, hand cutting waste material with a knife is avoided. Keeping waste from the production floor also ensures a safer operating environment.

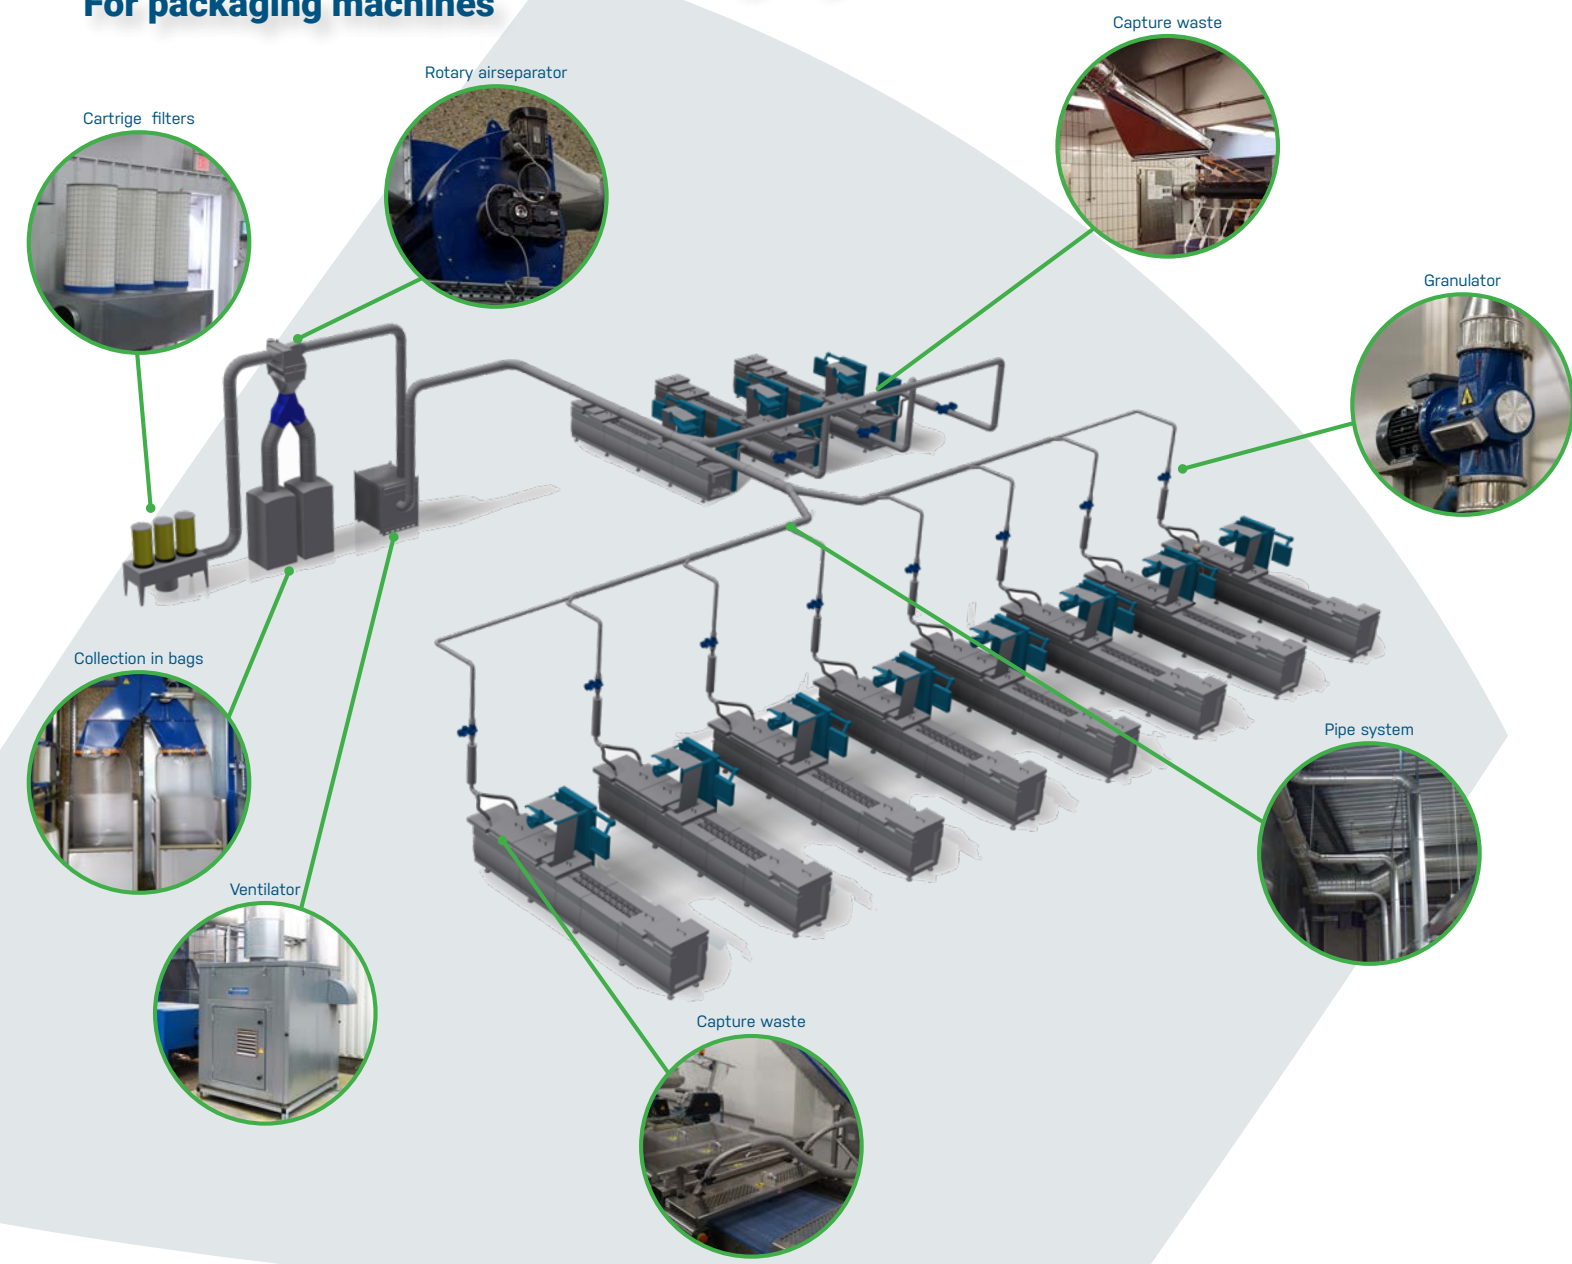

Fit it
and forget it

Trim, cross cuts, matrix and skeletons are captured using a vacuum powered system equipped with a powerful Granulator. The Granulator cuts the waste, after which it is compacted for removal. Eliminating waste bins frees up expensive product floor space and the reduced volume of compacted waste is more efficient to transport for recycling, cutting the cost and reducing the CO₂ emissions of waste disposal.

With the industry's leading Granulators, reliability and durability are exceptional, with more years between blade shifts and a minimum of service requirement.

EXPERIENCE AND EXPERTISE

With more than 6,000 systems and 10,000 Granulators installed across a wide range of industries all over the world, our experience puts us in a unique position to help customers define their optimal waste process based on our scalable modular components.

Headquartered in Denmark with locations in Germany, US and China, as well as having a presence in most parts of the world, we can support customers everywhere. By combining global experience with local expertise, we create the optimal solution for you and the environment.
